

a Rechunking a 512 × 512 uint16 array

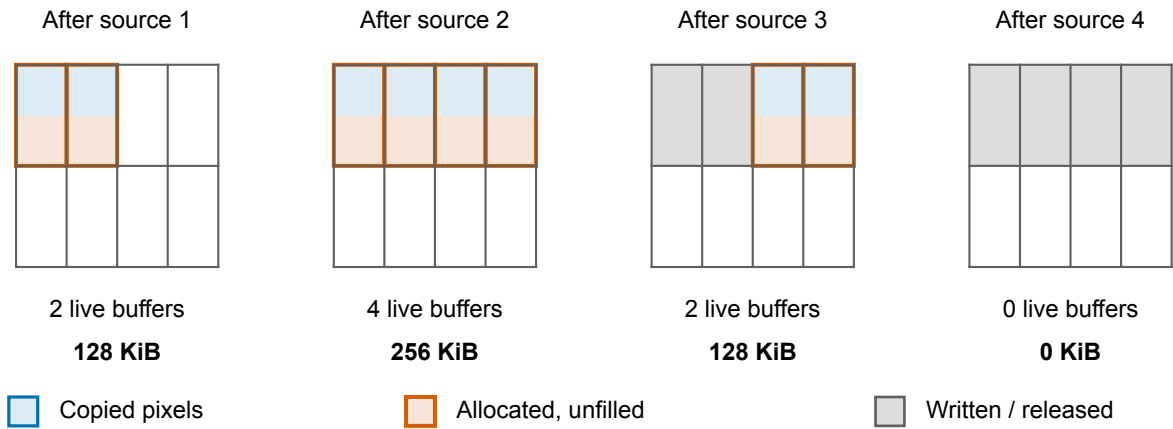

Read one source.
No prefetch or cache.

Copy to outputs.
Release source.

Write complete outputs.
Release after writing.

b Live output allocations after each step

c Largest raw-array live set (analytical)

64 KiB input + 4 × 64 KiB output = 320 KiB

Array allocations only; codec buffers and process overhead are additional.

Read / decode	One source request: compressed input + workspace.
Encode / write	One workspace + one encoded output; synchronous.
TIFF streaming	Extra decoding + queued images; absent here.
